                          signaling complex (DISC) performs caspase-8 protectory that which initiates the subsequent cascade of caspases (aspartate-specific cysteine proteases) mediating apoptosis (By similarity). SUBUNIT: Binding of TNF to the extracellular domain leads to homotrimerization. The aggregated death domains provide a novel molecular interface that interacts specifically with the death domain of TRADD. Various TRADD-interacting proteins such as TRAFS, RIP and possibly FADD, are recruited to the complex by their association with TRADD. This complex activates at least two distinct signaling cascades, apoptosis and NF-kappa-B signaling. Binds BAG4 (By similarity). Constitutively associated with
caspase-8 to the activated receptor. The resulting death-inducing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             -!- SUBCELLULAR LOCATION: Type I membrane protein.
-!- DOMAIN: Both the cytoplasmic membrane-proximal region and the C-
terminal region containing the death domain are involved in the
interaction with TRPC4AP.
-!- SIMILARITY: Contains 1 death domain.
-!- SIMILARITY: Contains 4 TNFR-Cys repeats.

                    This protein comprises human death domain containing receptor DR3, a novel member of the tumour necrosis factor receptor family. Its amino acid sequence was deduced from a CDNA clone (see AAR9427) isolated from a HUVEC CDNA library. Related death domain containing receptor DR3-VI (see AAW31516) has also been identified. Recombinant full-length or mature DR3, or the extracellular, transmembrane, intracellular or death domain of DR3 can be expressed in transformed host cells. These polypeptides can be used to treat diseases and disorders associated with the inhibition of apoptosis, or to screen for modulator compounds. Antagonists, such as antibodies raised against DR3-VI, can be used to treat diseases and disorders associated with increased apoptosis and for treat diseases and disorders associated with increased apoptosis and for treating inflammatory diseases and disorders

This novel polypeptide, designated Apo-3, is a protein that stimulates or induces apoptotic activity in mammalian cells purposes. Its amino acid sequence was deduced from a human foetal heart cDNA clone (see AAT91180).

The N-terminal 181 amino acids of Apo-3 are identical to the sequence of another novel apoptosis polypeptide, Apo-211 (see AAW26709). Also claimed are: polypeptides comprising the extracellular or death domain of Apo-3; chimeric molecules comprising Apo-3 fused to a heterologous amino acid sequence; antibodies that bind to Apo-3 or its extracellular domain; cucleic acids encoding the polypeptides, as well as vectors and host culls; a non-human transgenic animal containing cells that express nucleic acid encoding Apo-3; and a non-human knockout animal containing or NF-kappa-B- (NF-kB)- or UNK-mediated gene expression for therapeutic purposes. Apo-3-1gG fusion proteins can be used to inhibit apoptosis or NF-kB induction or UNK activation for therapeutic purposes, and can be used as immunogens for anti-Apo-3 antibody production. Apo-3 or Apo-21. Can also be used as assay standards. The animals can be used in drug
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               240

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention provides nucleotide sequences encoding death domain containing receptor polypeptides DR3-VT and DR3. The DR3-VT cDNA clone is contained in ATCC deposition No. 97456 and the DR3 cDNA clone is contained in ATCC deposition No. 97757. Recombinant vectors comprising the nucleic acid sequences and optionally the leader sequences are used for the recombinant production of the proteins. The present sequence represents the amino acid sequence of a death domain containing receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New death domain containing receptor and recombinant vector - optionally

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This sequence is the human apoptosis inducing receptor (AIR) of the invention. AIR is a Type I transmembrane protein, soluble forms of which can be used to regulate cell death in a therapeutic setting. Soluble AIR can be used in vitro to block apoptosis or AIR-expressing cells, or to screen agonists or antagonists of AIR activity. The cytoplasmic domain of AIR can be used to develop assays for inhibitors of AIR-induced cell death, which is useful to regulate cell death in a therapeutic setting as well as in vitro. Agonists of AIR activity can be used to kill tumour cells that express AIR, or I cells expressing AIR in autoimmune diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CTEPCGNSTCLVCPQDTFLAWENHHNSECARCOACDEQASQVALENCSAVADTRCGCKPG 120

The present sequence represents tumour necrosis factor receptor (INFR) TR31, also known as BT3, ApO3, WSL-10 r LARD. The invention relates to TUNFR related polypeptides TR1, TR3 and TR5 (see AAV05742-44) and their ligand TL3 (see AAV05745). TR1, TR3, TR5 and TL3 are used in claimed

methods of identifying agonists and antagonists, i.e. compounds that bind act to the receptors or ligand, and which activate (agonist) or inhibit activation of (antagonists) TR1, TR3, TR5 or TL3. A screening kit for identifying agonists, antagonists, ligands, receptors, substrates, enzymes etc. for TR1, TR3, TR5 or TL3 polypeptides is provided. The agonists and antagonists are useful for treatment of chronic and acute inflammation, arthritis, septicaemia, autoimmune disease e.g. inflammatory bowel disease, psoriasis, transplant rejection, graft versus host disease, infection, stroke, ischaemia, acute respiratory disease syndrome, restenosis, brain injury, AIDS, bone diseases, cancer (e.g. lymphoproliferative disorders), atherosclerosis, Alzheimer's disease, etc., caused by imbalance of TR1, TR3, TR5 or TL3
                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  180

                                                                                                                                                                                                                                                                                                                                                                                                                                                                   8
                                                                                                                                                                                  The present invention provides the protein and coding sequences for two death domain containing receptors, designated DR3 and DR3-VI. These receptors are involved in apoptosis, and the sequences given can be used in the treatment of cancers, infections, cardiovascular disorders such as arrhythmias, ischaemia, aneurysms, arterial occlusive diseases, embolisms and congenital heart defects, neurodegenerative diseases including Alzheimer's and Parkinson's diseases, autoimmune disease such as multiple sclerosis, arthritis, diabetes, Graves' disease, asthma and psoriasis, and to promote angiogenesis and wound healing
                                                                                                                                                                                                                                                                                                                                                                                                                                        240

```
This invention relates to a method of diagnosing chronic rheumatoid arthritis by digesting human genomic DNA with EcoRI and hybridising it with a probe for the DNA encoding the present protein which is a rheumatoid arthritis associated manamembrane protein. The method is used for the diagnosis of chronic rheumatoid arthritis, and for developing new
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        61 CTEPCGNSTCLYCPQDTFLAWENHHNSECARCQACDEQASQVALENCSAVADTRCGCKPG 120

                                                       The present invention relates to the human DR3 gene, which is associated with rheumatoid arthritis. Certain mutations in the gene can be linked to the disease. The sequences can be used to evaluate disease onset and its possibility and to provide therapy and remedies. The present sequence is a protein described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            120

```
polypeptides and the polymuclectide sequences encoding them. The PRO polypeptides, agoniats, antagoniats or anti-PRO antibodies are useful for treating benign or malignant tumours (e.g. renal, kidney, bladder, breast, etc), leukaemias and lymphoid malignancies, other disorders such as neuronal, glial, astrocytal, hypothalamic, glandular, macrophagal, stromal and blastocoelic disorders, inflammatory, immune and anglogenic disorders. The polymuclectide sequences are also useful in gene therapy. AAU86128-AAU86162 represent the human PRO polypeptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Thirty five nucleic acids encoding PRO polypeptides, useful for treating benign or malignant tumors, leukemias and lymphoid malignancies, inflammatory, angiogenic and immunologic disorders.
                                                                                                                                                                    Human; PRO; benign tumour; malignant tumour; lymphoid malignancy;

This invention relates to an isolated monoclonal antibody comprising an antigen binding site which binds to an Apo-2 ligand inhibitor (Apo-2II) polypeptide and an antibody that binds the Apo-3 protein. The antibodies of the invention may have cytostatic activity and may act as activators of the invention may be cytostatic activity and may act as activators of excessive cor stimulator of apoptosis in cancer cells, as blockers of excessive cor stimulator of the autoimmune/inflammatory effects of Apo-3 resulting from nuclear factor (NF)-kappaB activation or C-Jun-amino-terminal kinase (JNK) activation. The anti-Apo-2 ligand inhibitor is useful in cancer cells and may be used to block excessive apoptosis in cancer cells and may be used to block excessive apoptosis (for example in neurodegenerative disease), or to block potential autoimmune/
cells and may be used to block excessive apoptosis (NF)-kappaB activation or C-Jun-amino-terminal kinase (JNK) activation. The antibody cativation or C-Jun-amino-terminal kinase (JNK) activation. The antibody cor affinity purification of Apo-2LI or Apo-3 from recombinant cell culture or natural sources. The present sequence represents the harmaner continuation which was used to generate the antibody of the
                                                               Novel isolated monoclonal antibody useful for activating or stimulating apoptosis in cancer cells, comprises an antigen binding site which binds to an Apo-2 ligand inhibitor polypeptide or to an Apo-3 polypeptide.
                                                                                                                              Claim 1; Fig 4; 48pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              13-MAY-2003 (first entry)

```

The invention relates to an new isolated biologically active Apo-2LI or Apo-3 having at least 80 % sequence identity with native sequence Apo-2LI Cor Apo-3 appearing as ABU08251 and ABU08252. Also included are a chimacaric molecule comprising the Apo-2LI fused to a heterologous amino acid sequence; a dimer molecule comprising a first Apo-2LI and a second Apo-2LI or Apo-3L are a condition of the sequence). An isolated nucleic acid encoding Apo-2LI or Apo-3, a vector comprising the nucleic acid, a host cell comprising catter extracellular domain sequence), an isolated nucleic acid encoding Apo-2LI or Apo-3, a vector comprising the nucleic acid, a host cell comprising the vector, a method of producing Apo-2LI and a non-human (transgenic or Anockout) animal that contains cells that express nucleic acid encoding Apo-3 or cells having an altered gene encoding Apo-3. Apo-2LI or Apo-3 are involved in apoptosis (programmed cell death) which is implicated in ADOS, dequired immunodeficiency syndrome), stroke, Alzheimer's disease, Parkinson's disease, amyotrophic lateral sclerosis, multiple sclerosis, retinitis pigmentosa, aplastic anaemia, cerebellar degeneration, myocardial infarction, reperfusion injury and toxin-induced liver disease, the gene for both proteins is located on chromosome 1936.3 Apo-2LI and Apo-3 are also useful for preparing a composition for treating cancer. The present sequence represents Apo-3

The invention relates to an Apo-3 polypeptide having an extracellular domain (ECD) sequence and a death domain sequence. The Apo-3 polypeptide has been found to stimulate or induce apolyticity in mammalian cells. Human Apo-3 exhibites similarities to the tumour necrosis factor receptor (TNFR) family of polypeptides. The invention also relates to a chimeric molecule comprising an extracellular domain sequence comprising residues 1-198 of Apo-3 fused to a heterologous amino acid sequence. The Apo-3 polypeptide is useful therapeutically to induce apoptosis in ammmalian cells. Decreased levels of apoptosis and herpes virus infection. Increased levels of apoptosis are associated with diseases such as acquired immunodeficiency syndrome (AIDS), Alzheimer's disease, Parkinson's disease, amyotrophic lateral selevosis, multiple sclerosis, retinitis pigmentosa, cerebellar degeneration, aplastic anaemia, myocardial confidence of the Apo-3 polypeptide is also useful in non-therapeutic applications such as in quantitative diagnostic assays as a control against which samples containing unknown quantities of Apo-3 may be prepared, in generation techniques, and in competitive-type receptor binding assays. The chimeric molecule is useful therapeutically to inhibit apoptosis or nuclear factor -kappa B (NF-kappa B) induction, or as an immunogen for producing anti-chapsa attibodies. The present sequence repetent in the foetal heart
                                                                                                                                         Novel isolated Apo-3 polypeptide useful for inducing apoptosis in mammalian cells, for generating antibodies, in affinity purification techniques, and in competitive-type receptor binding assays.
                                                                                                                                                                                                                                              Claim 1; Fig 8; 52pp; English

New isolated Apo-3 polypeptides, useful for stimulating or inducing apoptotic activity in mammalian cells, e.g. cancer cells, or for in vivo or ex vivo gene therapy techniques.

5; Fig 8; 50pp; English Claim The invention relates to an isolated Apo-3 polypeptide. The Apo-3 polypeptides are useful for stimulating or inducing apoptotic activity in mammalian cells e.g. cancer cells, or for in vivo or ex vivo gene therapy techniques. The Apo-3 chimeric molecules are useful for inhibiting apoptosis, or as immunogens used in generating antibodies. The antagonistic antibodies may be used to block excessive apoptosis, instance in neurodegenerative disease, or to block potential autoimmune/ inflammatory effects of Apo-3 resulting from NF-kappaB activation. The nucleic acid sequences are useful as diagnostics for tissue-specific tryping, for preparing Apo-3 polypeptides, or for generating transgenic or kryping, for preparing Apo-3 polypeptides, or for generating transgenic or knockout animals The transgenic or knockout animals are useful in in---developing and screening of therapeutically useful reagents. The present sequence represents the amino acid sequence of human Apo-3

The present invention describes the use of an agonist or antagonist of GENCEPTIN activity for preventing or treating obesity. Also described is a method of screening for GENCEPTIN activity. Also described is a method of screening for GENCEPTIN activity free fatty acid oxidation, and useful insulin-like activity, free fatty acid oxidation, and antatreiosclerotic, cardiant, antidiabetic, hypotensive, ophthalmological, neuroprotective and nephrotropic activities GENCEPTIN can be used for treating or preventing obesity related disease or disorders, e.g. obesity, insulin resistance, atheroselerosis, atheromatous disease, heart disease (e.g. cardiac insufficiency, high blood presente), hypertension, stroke, syndrome X, insufficiency, high blood presente), hypertension, stroke, syndrome X, diabetes mellitus (type I and II), hyperlipidaemia and hyperuricaemia, also diabetic complications, e.g. microangiopathic lesions, coular lesions, retinopathy, neuropathy and renal lesions. The present sequence lesions, retinopathy, which is given in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New use of Genceptin agonists or antagonists for treating or preventing obesity-related diseases or disorders.

/label= Cysteine-rich domain 4
/note= "This cysteine-rich domain is apparently truncated
in Apo-2LI and contains only 3 cysteines instead of 6."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to an isolated biologically active Apo-2LI or Apo-3 which has at least 80% sequence identity with native sequence Apo-2LI having 1-181 amino acids or Apo-3 having 1-417 amino acids, respectively. Apo-3 can be employed therapeutically to induce apoptosis or NF-kappaB or JNK mediated gene expression in mammalian cells. The Apo-3 chimeric molecules can be employed therapeutically to inhibit apoptosis; necrosis factor (NF)-kappaB induction; c-Jun N-terminal kinase (JNK) activation.

apoptosis in vivo or ex vivo. Nuclear and sequences encoding the Apo-3 or Apo-2LI may be used as a diagnostic for tissue-specific typing. The isolated Apo-3 or Apo-2LI may be used in quantitative diagnostic assays as a control against which samples containing unknown quantities of Apo-3 or Apo-2LI may be prepared. Apo-3 preparations are also useful in generating antibodies, as standards in assays for Apo-3 or Apo-2LI, in affinity purification techniques, and in competitive-type receptor fluorophores. Modified forms of the Apo-3, e.g. radiolodine, enzymes, or fluorophores modified forms of the Apo-3, e.g. Apo-3-1gG chimeric molecules can be used as immunogens in producing anti-Apo-3 antibodies. Nucleic acids which encode Apo-3 or its modified forms can also be used to generate either transgenic animal producing anti-Apo-3 antibodies. Crat, which, in turn, are useful in the development and screening of therapeutically useful reagents. The Apo-3 polypeptide stimulates or induces apoptotic activity in mammalian cells. The present sequence represents the human apoptotic protein, Apo-3 Residues 1-181 of Apo3 represents the human apoptotic protein, Apo-3. Residues 1-181 of Apo3 represents the human apoptotic protein, Apo-3. Residues 1-181 of Apo3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              301 DQLPSRALGPAAAPTLSPESPAGSPAMMLQPGPQLYDVMDAVPARRWKEFVRTLGLREAE 360

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 4,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Description
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 15,

PIR 80:\* 1: pirl:\* 2: pir2:\* 3: pir3:\*

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

N/Alternate names: repressor protein F
C/Species: Bacherichia coli
A/Note: Bacherichia coli
C/Date: plasmid RSF1010 is a broad-host-range plasmid belonging to incompatibility group
C/Date: 31-Dec-1991 #sequence_revision 31-Dec-1991 #text_change 09-Jul-2004
C/Accession: JH0129; PS0292

Novel isolated Apo-2DcR polypeptide useful for modulating apoptosis in mammalian cells.

Disclosure; Page 37; 58pp; English.

The present invention relates to the isolation of novel human polypeptides, designated Apo-2DCR, and the polynucleotide sequences encoding them. Apo-2DCR is capable of binding Apo-2 ligand and is useful for modulating programmed cell death or apoptosis in mammalian cells. Apo-2DCR can be used to produce apo-2DCR antibodies which are useful therapeutically, and can cross-react with other receptors for Apo-2 ligand to block excessive apoptosis in neurodegenerative diseases, or to block potentially autoimmune or inflammatory effects. Apo-2DCR antibodies are also useful in immunohistochemistry staining assays or diagnostic assays for Apo-2DCR, e.g. detecting it's expression in specific cells, tissues or serum, and for the affinity purification of Apo-2DCR from

```
The present invention provides novel Apo-2 polypeptide and the encoding polynucleotide capable of modulating apoptosis. The invention is useful in diagnosing, treating and preventing cancer, tissue typing, in generating antibodies and transgenic animals. The invention is also useful in gene therapy. The present sequence is human Apo-3/DR3 protein. This sequence is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1 VMDAVPARRWKEFVRTLGLREAEIEAVEVEIGRFRDQQYEMLKRWRQQQPAGLGAVYAAL

                                                                                                                                                                        ö
          recombinant cell culture or natural sources. The present sequence represents a protein of unknown function relating to the present invention. Note: The present sequence is given in the Seq listing but is not mentioned elsewhere in the specification
                                                                                                                                                                                                      The present invention provides novel Apo-2 protein and the nucleic acid encoding the protein. The invention is useful in inducing apoptosis in mammalian cancer cells. The invention is also useful in diagnostic procedures for tissue-specific typing and in generating transgenic animals that are useful in development and screening of reagents. The invention is also useful in gene therapy. The present sequence is Apo3/DR3 death domain protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Apo-2; apoptosis; diagnosis; tissue-specific typing; transgenic animal; cancer; gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1 VMDAVPARRWKEFVRTLGLREAEIEAVEVEIGRFRDQQYEMLKRWRQQQPAGLGAVYAAL

comparison to a domain of a novel human tumour necrosis factor receptor, designated TR9. The TR9 receptor is also known as Death Domain Containing Receptor 6. TR9 polypetides, polynuclectides or agonists are useful for treating, preventing or diagnosing common variable immunodeficiency, X-linked agammaglobulinaemia, severe combined immunodeficiency and Wiskott-Aldrich syndrome, autoimmune diseases (such as rheumatoid arthritis,

The present invention relates to the isolation of a biologically active Apo-2 ligand inhibitor (Apo-2LI) or Apo-3, and the polynucleotide sequences encoding them. Apo-2LI and Apo-3 are involved in apoptosis. The Apo-2LI and Apo-3 are involved in apoptosis. The is useful for generating antibodies, as standards in assays for Apo-2LI apo-2LI, in affinity purification techniques, and in competitive-type receptor binding assays when labelled with radioiodine, enzymes or fluorophores. Agonistic Apo-3 antibodies are useful for stimulating or inducing apoptosis in cancer cells, and thus have therapeutic utility. The present sequence represents the death domain of a human TNF receptor family protein. This sequence is compared with the death domain of human
                                                                                                                                                                                                                                         Novel isolated biologically active Apo-2 ligand inhibitor polypeptide, or Apo-3 polypeptide which induces or stimulates apoptotic activity, useful in diagnostic assays.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1 VMDAVPARRWKEFVRTLGLREAEIEAVEVEIGR-FRDQQYEMLKRWRQQQP---AGLGAV 56

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 polypeptides, designated Apo-2DCR, and the polymucleotide sequences canding them. Apo-2DCR is capable of binding Apo-2 ligand and is useful cor modulating programmed cell death or apoptosis in mammalian cells. Apo-2DCR can be used to produce apo-2DCR antibodies which are useful therapeutically, and can cross-react with other receptors for Apo-2 ligand to block excessive apoptosis in neurodegenerative diseases, or to ligand to block excessive apoptosis in neurodegenerative diseases, or to block potentially autoimmune or inflammatory effects. Apo-2DCR antibodies are also useful in immunohistochemistry staining assays or diagnostic assays for Apo-2DCR, e.g. detecting it's expression in specific cells, tissues or serum, and for the affinity purification of Apo-2DCR from recombinant cell culture or natural sources. The present sequence represents a protein of unknown function relating to the present contention. Note: The present sequence is given in the Seq listing but is not mentioned elsewhere in the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1 VMDAVPARRWKEFVRTLGLREAEIEAVEVEIGR-FRDQQYEMLKRWRQQQP---AGLGAV 56

The present invention provides novel Apo-2 polypeptide and the encoding polynucleotide capable of modulating apoptosis. The invention is useful in diagnosing, treating and preventing cancer, tissue typing, in generating antibodies and transgenic animals. The invention is also useful in gene therapy. The present sequence is human TNFR1 protein. This sequence is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          A new nucleic acid encodes a p53-induced protein (Killer) - which induces apoptosis and is useful in the diagnosis and treatment of neoplastic

                                                                                                                                                                                                                                                                                                                                                      δ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           9
                                                                                                                                                                                                                   The present invention provides novel Apo-2 protein and the nucleic acid encoding the protein. The invention is useful in inducing apoptosis in mammalian cancer cells. The invention is also useful in diagnostic procedures for tissue-specific typing and in generating transgenic animals that are useful in development and screening of reagents. The invention is also useful in gene therapy. The present sequence is TNFR1 (tumour necrosis factor receptor 1) death domain protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New Apo-2 polypeptides and encoding nucleic acid molecules, useful for diagnosing, preventing or treating cancer, and in tissue typing or in generating antibodies or transgenic animals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1 VMDAVPARRWKEFVRTLGLREAEIEAVEVEIGR-FRDQQYEMLKRWRQQQP---AGLGAV
                                                                                            New Apo-2 polypeptide or its extracellular or death domain sequence, useful for modulating apoptosis in mammalian cancer cells or for generating transgenic or knockout animals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Apo-2 protein; apoptosis; cancer; tissue typing; transgenic animal; gene therapy; human; TNFR1; receptor.

The invention relates to human polymucleotides (AAI79941-AAI93841) and the encoded proteins (AAO00010-AAO13910) that exhibit activity elating to cytokine, cell proflieration or cell differentiation or which may induce production of other cytokines in other cell populations. The polymucleotides and polymeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, hematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity and may be useful in the diagnosis and/or transmention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format

The present sequence is the death domain of TNFR 1. It was used for comparison to a domain of a novel human tummour necrosis factor receptor, designated TR9. The TR9 receptor is a slow known as Death Domain Containing Receptor 6. TR9 polypeptides, polynucleotides or agonists are useful for treating, preventing or diagnosing common variable immunodeficiency, X-linked agammaglobulinaemia, severe combined immunodeficiency and wiskott-Aldrich syndrome, autoimmune diseases (such as rheumatoid arthritis, allergic encephalomyelitis, multiple sclerosis, diabetes mellitus and asthma), HIV infection, epilepsy, cancer, cardiovascular diseases and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 65

ADG42594 standard; protein; 75 AA.

```
AAW00207 shows the death domain of the p55 tumour necrosis factor receptor (p55 TNF-R). The death domain (DD) of human Fas-ligand receptor (FAS-R), ankyrin 1, nerve growth factor receptor (NGFR) and MORT-I (which binds to the intracellular portion of (FAS-R)) are also given (see AAW00206-07 and AAW00209-W00210). These DDs are used to identify and Compounds capable of modulating activity of the regulatory proteins (p55, NGF, TNF and FAS-R ligand, MORT-I) via interaction with the DDs. Such modulators which may be antibodies, antisense sequences or ribozymes (which can affect the cellular mRNA sequences encoding the proteins) and are useful for modulation of effects of the regulatory proteins) and care useful for modulation of effects of the regulatory proteins) and the cell. Tumour cells, HIV-infected cells or other diseased cells can be treated by targeting the cells with animal viral vectors encoding the codulators and a viral surface antigen capable of binding to a specific receptor. The DDs are characterised by having groups of common amino acid residues Trp, Ala, Asp, Glu, Thr, Arg and Tyr within locations that can be aligned to show homology
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Modulator of regulatory cellular events mediated by "death domain" contg. regulatory proteins - useful for modulating functions mediated in cells by proteins contg the death domain.
                                                                                                                                                                                                                                                                                                      Death domain; regulatory protein; NGF-R; nerve growth receptor; FAS-R; FAS ligand receptor; FAS/APO1; ankyrin 1; p55 TNF-R; tumour necrosis factor receptor; MORT1; cell cytotoxicity; HIV; human immunodeficiency virus; cancer; neoplasia; disease.

The invention describes a new isolated polypeptide comprising: a polypeptide or its mature form comprising a sequence not given in the specification, or a variant of (A), where one or more amino acid residues in the variant differs in no more than 15% from the amino acid sequence of the mature form. The pharmaceutical composition may be administered via oral, transdermal, rectal or parenteral route. The polypeptide, nucleic acid or antibody is useful for preparing a composition for treating or preventing a NOVX-associated disorder, e.g., cancer. This is the amino acid sequence of a protein associated with analysis of domains
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 65

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

generate two sets of results each. The Published\_Applications databases have been split into two parts to Published\_Applications Nucleic Acid and Published\_Applications Amino Acid database searches now reduce the amount of time required for their daily updates. This results in more machine time being available for processing searches.

Newly published applications will appear in the Published\_Applications\_New databases; older published applications make up the Published Applications. Main databases. Searches run against Nucleic Acid Published\_Applications produce two sets of results, with the extensions Searches run against Amino Acid Published\_Applications produce two sets of results, with the extensions .rnpbm (Published\_Applications\_NA\_Main) and .rnpbn (Published\_Applications\_NA\_New). rapbm (Published\_Applications\_AA\_Main) and .rapbn (Published Applications\_AA\_New)

Pending Nucleic Acid and Pending Amino Acid database searches generate two sets of results each. The Pending databases have been split into two parts to reduce the amount of time required for their daily updates. This results in more machine time being available for processing searches.

Searches run against the Nucleic Acid Pending database produce two sets of results, with the extensions .rnpm and .rnpn

Searches run against the Amino Acid Pending database produce two sets of results, with the extensions .rapm and .rapn

Because they contain data that is confidential, the results of Pending database searches should not be left in the case .
